

1. Differentiate effectiveness and efficiency

Effectiveness refers to the ability of a product to enable users to accomplish their intended objectives or perform activities satisfactorily. On the other hand, we have efficiency which captures how fast or to what extent a user can accomplish all those goals with a lot of ease and fewer efforts required. In short, effectiveness is the degree to which one reaches the desired objective while efficiency is the degree to which one reaches that goal in the least possible time and with least exerted effort.

2. -How do usability goals differ from user experience goals?

-Are there trade-offs between the two kinds of goals?

-How easy is it to measure usability versus user experience goals?

Usability goals are about ensuring the product being delivered is practical, easy to use and effective on its use while user experience goals are about making a product enjoyable, fun, and evoking positive emotions during or after its use.

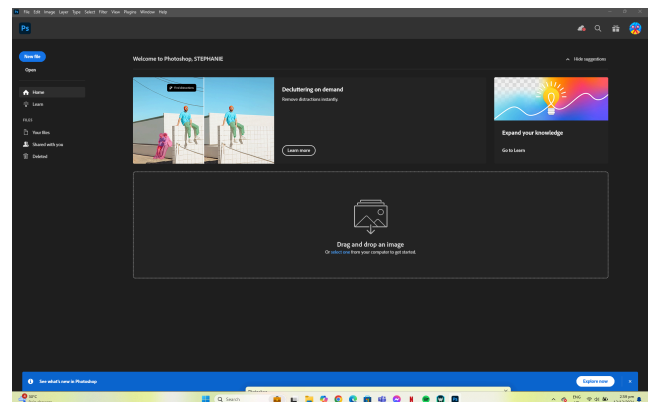

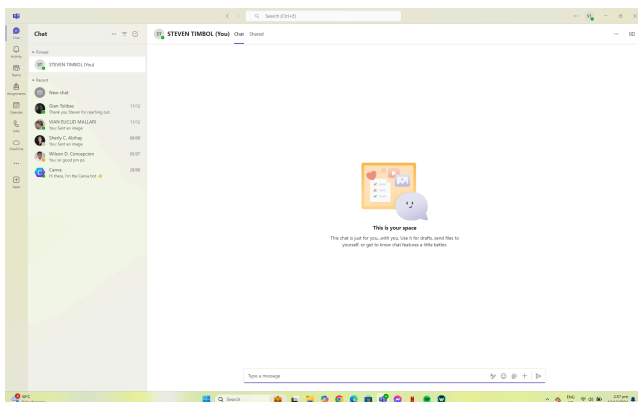

Yes, there are indeed situations where usability and user experience goals are competing in some way, for instance, when you focus on a goal that is easily achievable (usability) you may reach it at the cost of making the experience less involving or pleasurable (user experience) and vice versa.

Usability is easier to measure since it is based on factors such as tasks completion time, error rate and success rate while user experience is difficult to quantify since it is based on factors such as user emotions, satisfaction and enjoyment which are usually measured by surveys and interviews.

3. Logical and Ambiguous design Which is better?

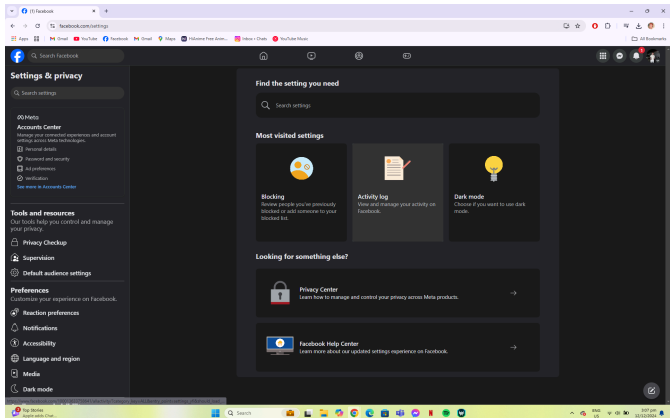

In my opinion I'm choosing A as a better design. Unlike option B, option A's design is closer to the socket the user can easily identify which is going to be connected. Option B's design is based on color only, in some scenarios, there may be a chance that a user is color blind and will not tell which is what, which makes option A accessible and user friendly.

4. Give 2 examples of an application that you have use that somehow confuses you because of inconsistencies both internal and external (justify your answer)

The 2 applications that I chose are Microsoft Teams and Adobe Photoshop, they are both great platforms but they are hard to use most of the time. You may have encountered several bugs around Microsoft teams. It is such a slow application and complicated to use when you have a meeting you can't just join instantly, you'll have to find the join meeting button and sometimes it doesn't work. On the other hand, Adobe Photoshop is a great software to use for editing. But it becomes harder to use the more you need to detail every project

Give 2 examples of an application interface or interactive design that has poor visibility

Facebook (Privacy Settings and Permissions) Netflix (Content Discovery and Filters)

Facebook, Privacy Setting & Permissions

Poor Visibility Issue:

First of all, privacy settings in Facebook are hidden and improper to maneuver. Crucial configurations not only for privacy like who can see your posts, who can send you a friend request, or how your data is used are hidden deep in the settings menu, sometimes are grouped under such non-descriptive names as Settings or Privacy Shortcuts.

Netflix, specifically its wise content discovery mechanism and selection filters.

Poor Visibility Issue:

Although Netflix offers subscribers a great deal of choice across different films and television shows it is, however, very difficult for a user to search them by the particular genres or new films and television shows. The “More Like This” section is always hidden and sometimes it does not have a broad set of filters, which enable a user to refine the search results. Some of the recommendations are algorithmically generated yet many are not related to the user’s viewing pattern.

Provide examples of devices that fails to consider affordances

Problem:

Some of the Bluetooth speakers are difficult to connect to a smartphone or a computer through Bluetooth. It can be several buttons or flashing lights, and the user does not understand what they need to do to enter the pairing mode, making them feel like they made some mistake when nothing happens the Result, The user cannot get the device to connect, which ends up frustrating and confusing for those who are not knowledgeable concerning Bluetooth pairing.
